Aura — Client Installation & Deployment Playbook

Commercial handoff guide: Zero-source-code distribution via pre-built Docker containers

IP Protection & Architecture: When licensing Aura to a client or clinic, you **never transfer your source code repository**. Instead, pre-compiled Docker images are pushed to a container registry (Docker Hub / GitHub Packages). The client only receives two files: docker-compose.yml and .env. All AI processing (Whisper large-v3, pyannote, Ollama) runs 100% locally on the client's machine.

1. Client Hardware & System Checklist

Requirement	Minimum Specification	Recommended Specification
Processor (CPU)	Apple Silicon (M1/M2/M3) or 4-core PC	Apple Silicon (M2/M3/M4 Pro/Max) or 8-core PC
System Memory (RAM)	8 GB Unified / DDR4	16 GB or 24 GB Unified Memory
Free Disk Storage	15 GB SSD space	25 GB+ SSD space
Operating System	macOS Sonoma (14+) or Windows 11 / Linux	macOS Sequoia (15+)
Power Connection	Connected to power adapter during setup	Always plugged into charger during clinic hours

2. Vendor Build & Client Installation (No Source Code Shared)

Step 2.1: On Your Developer Machine — Tag & Publish Docker Images

Build and publish compiled container images to your private Docker Hub or GitHub Container Registry:

```
docker build -t yourusername/aura-backend:latest ./backend
docker build -t yourusername/aura-frontend:latest ./frontend
docker push yourusername/aura-backend:latest
docker push yourusername/aura-frontend:latest
```

Step 2.2: On the Client Laptop — Install Docker Desktop

- Download and install **Docker Desktop** from *docker.com/products/docker-desktop*.
- In Docker Settings → General, enable: **Start Docker Desktop when you log in**.
- Under Settings → Resources, assign at least **4 CPU cores** and **6 GB RAM**.

Step 2.3: Provide Only 2 Files to the Client (docker-compose.yml & .env)

Create a folder on the client's laptop (e.g. ~/aura) containing ONLY these two files (no source code folders):

~/aura/docker-compose.yml:

```
services:
backend:
image: yourusername/aura-backend:latest
ports: ["8000:8000"]
env_file: [.env]
frontend:
image: yourusername/aura-frontend:latest
ports: ["3000:3000"]
env_file: [.env]
ollama:
image: ollama/ollama:latest
```

```
volumes: [ollama_models:/root/.ollama]
```

2. Vendor Build & Client Installation (Continued)

Step 2.4: Configure the Client's .env File

Populate ~/aura/.env with their dedicated Supabase database credentials:

```
SUPABASE_URL=https://<client-ref>.supabase.co
SUPABASE_SERVICE_ROLE_KEY=<service-role-key>
SUPABASE_JWT_SECRET=<jwt-secret>
NEXT_PUBLIC_SUPABASE_ANON_KEY=<anon-key>
NEXT_PUBLIC_API_URL=http://localhost:8000
OWNER_EMAIL=<client-email@domain.com>
```

Step 2.5: Launch Stack & Download Local LLM

In Terminal on the client's laptop, run:

```
cd ~/aura
docker compose pull
docker compose up -d
```

- Docker pulls your compiled images and the official Ollama container.
- Verify health status: curl http://localhost:8000/api/v1/health → returns {"status":"ok"}.

Step 2.6: Configure Keep-Awake (Amphetamine)

- Install **Amphetamine** from the Mac App Store (free).
- In *Preferences* → *Triggers*, set trigger: **When Docker Desktop is running** → **Keep awake indefinitely**.
- In *General*, check **Allow display to sleep** so the screen turns off safely during background processing.

3. Client Experience: 1-Click Desktop App (PWA) & Name Privacy

- **Install Desktop App:** Open **http://localhost:3000** in Chrome → click **Install App (⊕ icon)** in address bar → Aura is placed directly on their macOS Dock/Applications folder.
- **First-Name-Only Privacy Policy:** Across all clinician and patient views (Dashboard greeting, Patient roster, Session links, Schedule agenda, Memory search), Aura automatically formats and displays only the **first name** to protect privacy during screen sharing.

4. Clinician Onboarding & Acceptance Checklist

Task	Action Required	Verification / Expected Outcome
1. User Registration	Sign up using clinician's primary work email	Account created, onboarding wizard displayed
2. Microphone Access	Click 'Record' on New Session page	Browser prompts for microphone access → Click Allow
3. Test Audio Recording	Record a 30-second mock conversation	Waveform displays live audio levels in real time
4. Test Transcription	Click 'Generate Note' button	Notification arrives in ~1 min with structured SOAP note
5. Patient Memory	Ask query: 'What symptoms were discussed?'	Synthesizes answer with cited transcript excerpts
6. PDF Export	Click 'Export Note as PDF'	Formatted PDF clinical note downloads to local drive

5. Support & Client FAQ

- **Laptop Restart:** Docker Desktop starts automatically on login; the clinician simply clicks the Aura Dock icon.

- **Software Updates:** When you push a new release, the client simply runs docker compose pull && docker compose up -d.
- **Data Confidentiality:** Audio is permanently purged after note extraction; notes are indexed locally.
